This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 101003656

Side-event at UNFCCC SB58 Conference

# Sufficiency in FULFILL

that they are **within planetary boundaries**, and simultaneously **contributes to societal well-being**." "FULFILL understands the **sufficiency principle** as **creating the social**, **infrastructural**, **and regulatory conditions** for changing individual and collective lifestyles in a way that **reduces** energy demand and greenhouse gas emissions to an extent

### sufficiency principle as enabler for (structural) change – that needs enabling structures

sufficiency as (voluntary) reduction of absolute emissions

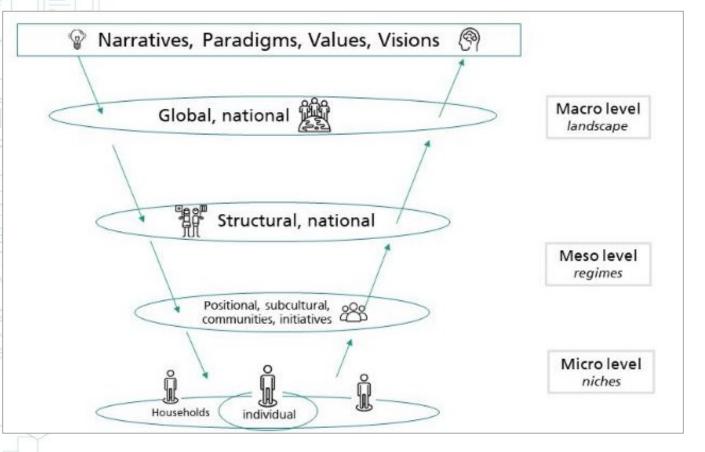

assumes that structures enable sufficiency and a 'good life' in line with basic need satisfaction: sufficiency as indicator and driver for individual and societal well-being

Deliverables on conceptual considerations: <u>https://fulfill-sufficiency.eu/publications/</u>

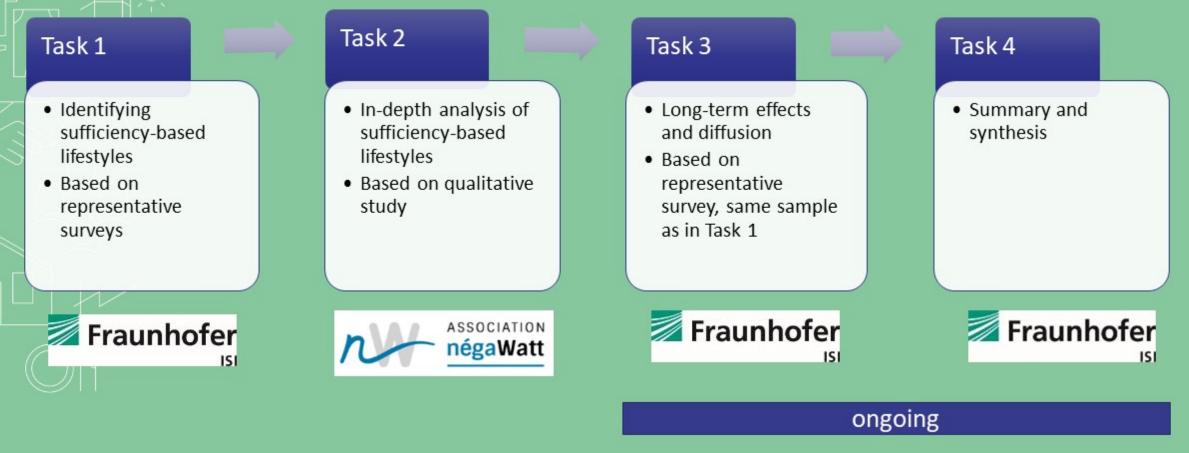

### Scope and research questions

see Deliverable 2.3. https://fulfill-sufficiency.eu/publications/

- Multi-level & multi-method approach
- Broad description of sufficiency lifestyles and initiatives (e.g. eco villages)
- Disentengle sufficiency by force (i.e. poverty) from sufficiency by intent
- Explore drivers and barriers for sufficiency lifestyles across European countries (infrastructures, socio-structural variables)

### Tasks and respective methods Micro and meso level perspective

# **Carbon footprint calculations**

Space and hot water heating

0000

fuel source, energy consumption, energy costs and/or building characteristics

electricity consumption in kWh or electricity costs;

"Green" electricity considered to have no emissions; Electricity produced via PV deducted

### Motorised transport

distance travelled and fuel source for transport by car and motorbike

### **Nutrition**

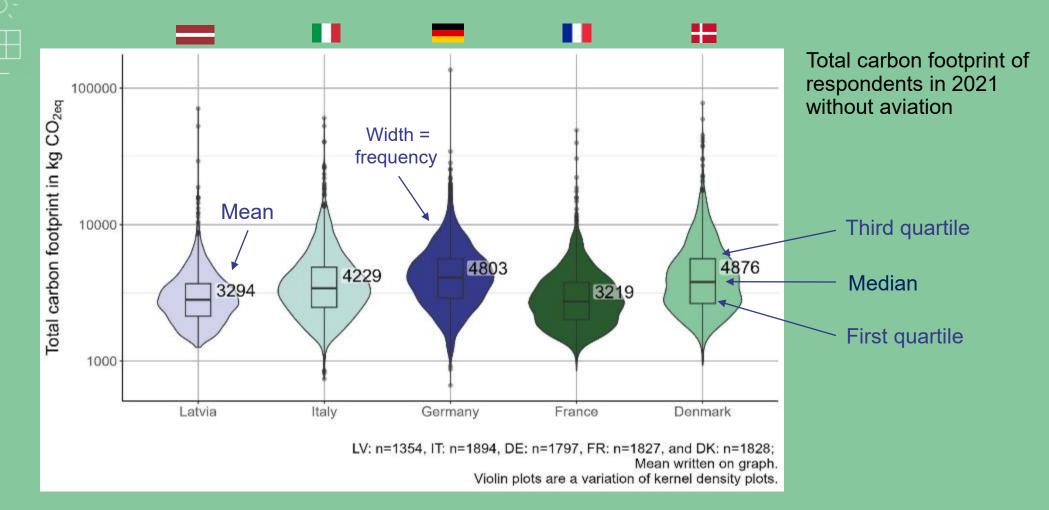

main diet type (vegan, vegetarian, flexitarian, mixed, high meat) and whether food purchased is seasonal and/or regional

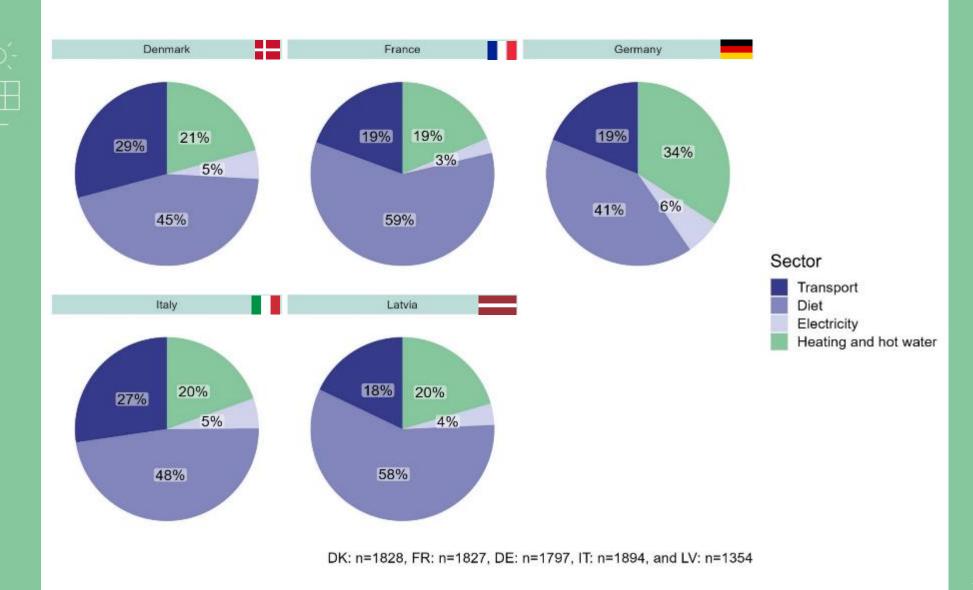

**Total carbon footprint** (CO<sub>2</sub>-equivalent in kg per capita per year)

### **Total carbon footprint**

### Carbon footprint by sector

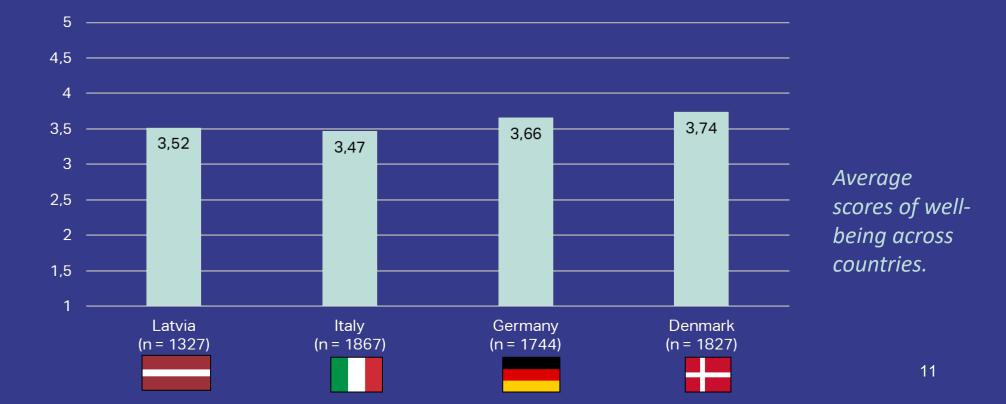

# Wellbeing & health

programming err<mark>or in</mark> FR

- QOL Scale by WHO, overall score across the 11 items
  - good reliability in all countries

- one factor solution appears feasible
- excluded participants who did not answer one or more QOL items

# Correlations: Wellbeing & CO<sub>2</sub>

bivariate correlations: \*\*\* p < .001 \*\* p < .01 \* p < .05

excluded participants with <0 and >100t carbon footprint (without flights)

### Sufficiency group identification method

### **Description of groups**\*

Group I -Very sufficient Individuals in this group are predominantly **female**, **not deprived** and tend to exhibit **a sufficiencyoriented lifestyle**.

These individuals are **not deprived**, and are **comfortable on their current income**. They tend to support **environmentally oriented policies** and consider themselves to be **eco-friendly consumers.** 

Group II – Sufficient

Group III – Low Carbon Footprint, Low Well-Being In this group, individuals are predominantly **female**, tend to have a **low income** and to **not be employed full-time**. They exhibit many characteristics of **deprivation**, including **not having a stable income** and **not being able to afford balanced meals**. They tend to have **unsafe conditions in the winter** months and feel they **require more living space**. They tend **not to support liberal** oriented policies. They are also more likely to **clean**, to do the **shopping**, the **washing**, and to take care of **social life on their own**.

\*Denmark, Germany, Italy, Latvia; based on Chi<sup>2</sup> tests and Welch ttests

19/06/2023

Individuals in this group are not particularily homogenous. They tend to be **male**, and **require more living space**.

Group IV – Average Carbon Footprint

Group V – High Carbon Footprint These individuals tend to be male, to have a high income, to live in a house, and to not live in large cities. They tend to be employed full-time and do not display signs of deprivation. They tend to prefer conservative policies and do not exhibit a sufficiency-oriented lifestyle. It is more likely that someone else in the household does the cleaning, the washing, and takes care of social life.

### **Deprivation and sufficiency** Is Sufficiency (partly) a result of (perceived) deprivation?

Based on regression models (ceteris paribus):

• For each additional 1000€ the respondent earned per year, their carbon footprint increased by 44kg CO₂eq.

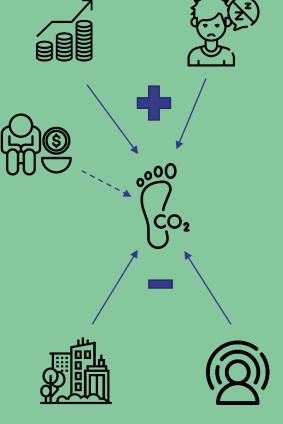

• The total carbon footprint of respondents who **could not afford a week's holiday** was **495kg CO<sub>2</sub>eq higher** than those who could afford a week's holiday.

• Respondents who could not afford an unexpected expense were 5,3%-points more likely to be in the high total carbon footprint group.

• The total carbon footprint of respondents who were more likely to consider new things to be a waste was 1100kg CO<sub>2</sub>eq lower than those who weren't.

• Respondents who like to possess less were 4,4%-points more likely to be in the low total carbon footprint group.

• Respondents who live in **a rural area** compared to an urban area were 14,8%-points **more likely to be in the high total carbon** footprint group.

(Alexander-Haw et al., in prep.)

# Wrap up & next steps

Foto von Etienne Girardet auf Unsplash

### **Sufficiency lifestyles across Europe**

- We find people showing high sufficiency and wellbeing across countries and common predictors = good news
- GE & DK with higher awareness but also higher emissions
- Income and deprivation plays a significant role both contradicts sufficiency
- Sector specific sufficiency and well-being aligns with each other but detailed exploration needed
- Infrastructures seem to give people the ability to decrease consumption by intent (e.g., electricity)

### Next steps:

- Exploring and analysing causality by using data from the second wave (changes in carbon footprint, SO, well-being over time)
- Framing experiments on policy support for sufficiency-oriented nutrition and housing

see Deliverable 3.1. coming soon!

### **THANK YOU**
