

BIOGAS PROJECT

Beginning of the construction—digging of a trench

Stowage of drain system

Laying of the digester's basement

Bottom of the digester is filled with concrete taking into consideration substratum drainage during the process of processing

Damp course of the biogas digester is an obligatory operation in construction.

Erection of the unloading aperture.

Building of the biogas digester is the cheapest option.

After erection the setting is thoroughly targeted

Montage of input pipe.

Checking of impermeability of digester's tank

Erection of the dome is one of the most difficult stages of construction

after damp course the dome is filled with concrete casing

providers of raw materials for biogas digesters

cast-off bricks could be used for building of biogas digesters

equipment used during construction of biogas digesters
